

SECTION 1: INTRODUCTION AND PRODUCT OVERVIEW

Truelift is an advanced marketing intelligence and measurement platform specifically designed to help modern consumer brands accurately assess the real impact of their advertising efforts. Operating as India's first dedicated ad incrementality measurement platform, Truelift addresses a critical blind spot in modern digital marketing: the inflation and inaccuracy of traditional attribution models. Backed by expert advisory teams and utilized by over twenty-five ambitious consumer brands, the platform serves as a unified intelligence engine that integrates multiple data streams to provide a single truth regarding marketing performance.

At its core, Truelift functions to eliminate the guesswork from media buying by providing a clear view of where marketing budgets actually generate new value. Rather than allowing individual advertising channels to self-report and overstate their performance, Truelift aggregates and independently analyze data from direct-to-consumer websites, e-commerce marketplaces, quick commerce platforms, and offline retail stores. By establishing a direct link between aggregate media spend and net-new revenue, the platform gives performance marketing leaders, chief marketing officers, and business founders the data-backed confidence required to optimize their investments and scale businesses effectively.

SECTION 2: MODERN MEASUREMENT METHODS AND SOLVING THE ATTRIBUTION CRISIS

Traditional advertising measurement heavily relies on last-click or touchpoint attribution models. In these legacy setups, ad platforms frequently grade their own performance, counting any transaction that interacted with an ad as a direct conversion caused by that ad. This method consistently inflates platform return on ad spend metrics by approximately forty to sixty percent, as it captures demand that would have naturally converted regardless of media visibility. Truelift counteracts this systemic misallocation by implementing modern, scientifically rigorous measurement frameworks.

The primary method leveraged by Truelift is incrementality measurement, which identifies the true incremental lift—meaning the exact volume of sales that would not have happened without the presence of the advertisement. To achieve this without relying on volatile user-level tracking, Truelift implements marketing mix modeling and geo-testing methodologies.

By splitting regional markets into comparable groups and employing synthetic controls, the platform builds a modeled synthetic twin for active test markets. It then reads the precise gap between actual performance and the baseline projection. This allows brands to run continuous, always-on calibration and matched-market experiments, creating a reliable infrastructure for privacy-first, ecosystem-wide marketing measurement that operates independently of third-party cookie restrictions.

SECTION 3: CORE PLATFORM FEATURES AND SERVICE OFFERINGS

Truelift delivers an array of predictive and analytical features via a centralized operational dashboard. The features are engineered to cover the complete experimentation and budget lifecycle:

Incremental Lift Reporting: The platform strips out platform-reported inflation to reveal the true return on ad spend that each independent channel earns. It breaks down performance across native networks, search engines, quick commerce channels, and offline environments.

Always-On Calibration and Synthetic Experiments: Every data output within the engine tracks back to live, active experiments. Users can deploy geo-lift tests using advanced synthetic twins alongside robust pre-test power checks to ensure statistical relevance before launching a campaign.

Cross-Channel Halo Tracking: Truelift exposes hidden spillovers where top-of-funnel brand campaigns or social media pushes quietly drive demand on external quick-commerce apps or physical retail shelves, even if the primary ad dashboard suggests weak direct performance.

Budget Recommender and Scenario Planner: The platform features algorithmic systems that analyze marginal returns across active channels. It allows teams to simulate spend adjustments, showing how reallocating funds between platforms like Meta, Google, and quick-commerce channels can maximize incremental sales within the same total budget.

Expert Advisory Support: Beyond software functionality, Truelift includes monthly strategic support guided by dedicated measurement specialists with direct experience from major ad ecosystems like Meta and Amazon, ensuring companies execute testing cadences correctly.

SECTION 4: COMPREHENSIVE OMNICHANNEL AND MULTIMEDIA COVERAGE

A major limitation of standard digital tools is their inability to account for channels outside their immediate network. Truelift distinguishes itself by offering comprehensive cross-channel tracking that places online and offline media under a unified framework.

On the revenue generation side, the engine ingests and reconciles transactional data from direct e-commerce, marketplace networks, rapid delivery applications, and traditional offline retail points. Simultaneously, it maps this data against diverse advertising efforts. This includes performance marketing channels, top-of-funnel brand campaigns, over-the-top streaming platforms, connected television, and conventional offline print or television broadcasts. By analyzing all performance vectors uniformly, the platform ensures that offline activities receive proper validation and that online channels are credited accurately for driving physical store footfalls.

SECTION 5: SYSTEM VALUE VALIDATION AND BUSINESS IMPACT

The practical deployment of Truelift has yielded measurable growth for fast-growing retail and consumer brands. Performance marketing agencies rely on the platform to answer complex incrementality questions, unlocking scaling strategies that standard click-tracking fails to notice and providing the clear data needed to restructure client media deployments.

Case studies across high-growth consumer brands illustrate that transitioning to incrementality-driven thinking can lead to swift financial optimizations. For example, brands scaling past major revenue milestones have utilized the platform to confidently redistribute

up to half of their existing marketing budgets away from inflated channels toward higher-performing assets, securing immediate percentage gains in total sales volume. Similarly, optical and medical lens manufacturers have successfully deployed Truelift to trace the specific influence of digital media campaigns on brick-and-mortar retail traffic, leading to measurable single-digit increases in both physical store footfalls and overall revenue.

SECTION 6: ONBOARDING AND ENGAGEMENT FRAMEWORK

Truelift operates on an engagement process driven by customized assessment rather than standard open-access subscription tiers. Because accurate marketing mix modeling and incrementality experimentation require deep technical alignment with an enterprise's data pipelines, the platform does not feature automated public sign-ups or standardized self-service pricing checkout flows on its main portal.

To initiate services, companies go through a dedicated onboarding architecture. Prospective clients use the corporate interface to schedule a formal demonstration and discovery meeting with Truelift's engineering and advisory specialists. During this initial alignment phase, the core data infrastructure, existing ad spend scales, and unique distribution channels of the brand are audited. Following the consultation, Truelift provides a tailored operational framework, custom pricing alignment matching the scale of the analyzed media spend, and a deployment roadmap managed alongside their internal specialist team.
